Three Steps for Deep Learning

Neural Network

Different connection leads to different network structures

Network parameter θ : all the weights and biases in the "neurons"

Fully Connect Feedforward Network

This is a function.

Input vector, output vector

$$f\left(\begin{bmatrix} 1 \\ -1 \end{bmatrix}\right) = \begin{bmatrix} 0.62 \\ 0.83 \end{bmatrix} \quad f\left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}\right) = \begin{bmatrix} 0.51 \\ 0.85 \end{bmatrix}$$

Given network structure, define a function set

Matrix Operation

$$\sigma\left(\underbrace{\begin{bmatrix} 1 & -2 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ -1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \end{bmatrix}}_{\begin{bmatrix} 4 \\ -2 \end{bmatrix}}\right) = \begin{bmatrix} 0.98 \\ 0.12 \end{bmatrix}$$

Output Layer as Multi-Class Classifier

Feature extractor replacing
feature engineering

FAQ

- Q: How many layers? How many neurons for each layer?

Trial and Error

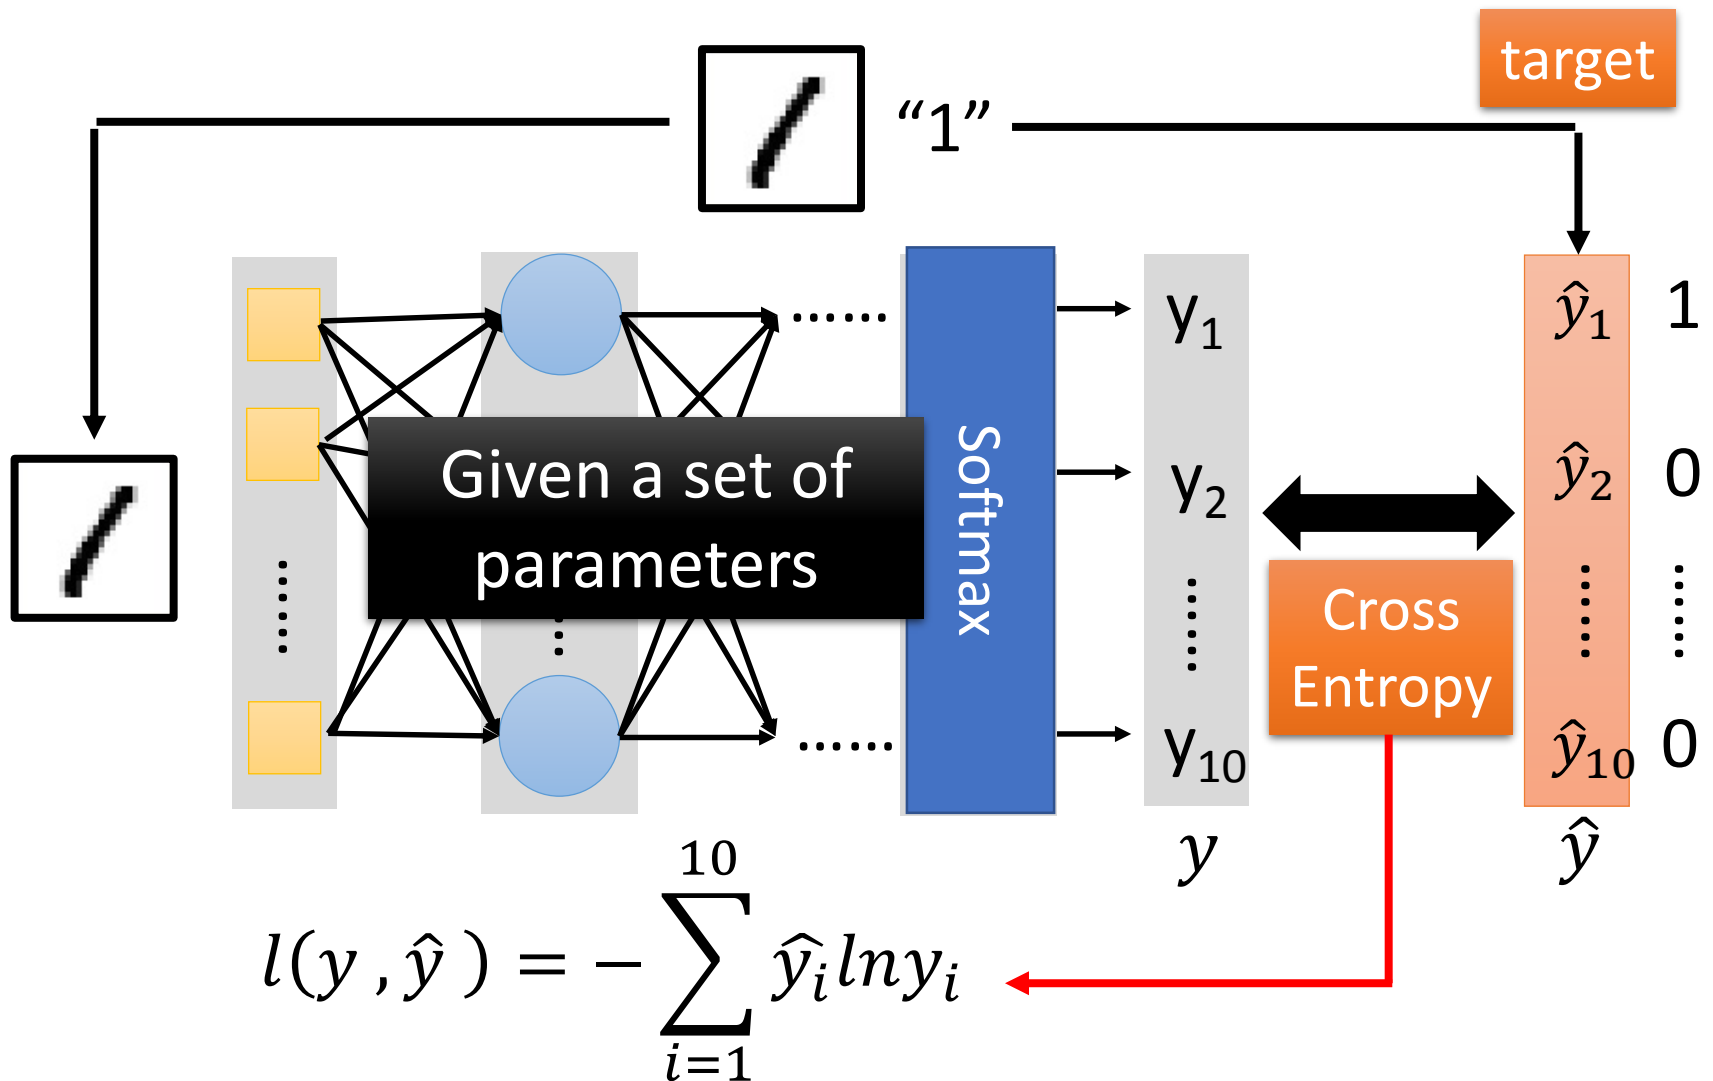

+

Intuition

- Q: Can the structure be automatically determined?
 - E.g. Evolutionary Artificial Neural Networks
- Q: Can we design the network structure?

Convolutional Neural Network (CNN)

Loss for an Example

Total Loss

For all training data ...

Total Loss:

$$L = \sum_{n=1}^N l^n$$

Find a function in function set that minimizes total loss L

Find the network parameters θ^* that minimize total loss L

Gradient Descent
